oop - Object Oriented design for PHP application - Stack ...
The PHP Data Objects (PDO) philosophy. Thankfully a database connectivity saviour does exist in PHP – and this is in the form of the three letter acronym PDO, which stands for PHP Data Objects. The idea of the PDO library is that it provides a standardised foundation on which you can connect to any relational database management system (RDBMS) that can be queried using SQL.

PHP Classes and Objects - codescracker.com
In PHP 5+, objects are passed by reference. This has got me into trouble in the past when I've tried to make arrays of objects. For example, I once wrote something like the following code, thinking that I'd get an array of distinct objects.

Design Patterns - PHP: The Right Way
Constructor Functions. Constructor Functions are special type of functions which are called automatically whenever an object is created. So we take full advantage of this behaviour, by initializing many things through constructor functions. PHP provides a special function called __construct() to define a constructor.

into logical, maintainable chunks. In this course Matthew Machuga will take you through various different OOD techniques, patterns, and concepts to help improve the sustainability and testability of your code base.

Object Oriented Programming in PHP - Tutorialspoint
PHP's nested, associative arrays might be a good replacement for nested JS objects depending on what you're trying to do. – kennsorr May 10 at 15:22 add a comment | 1 Answer 1

php create object without class - Stack Overflow
Think SECURITY when processing PHP forms! This page does not contain any form validation, it just shows how you can send and retrieve form data. However, the next pages will show how to process PHP forms with security in mind! Proper validation of form data is important to protect your form from hackers and spammers!

Page Object Model (POM) | Design Pattern - tajawal - Medium
PHP 5 is very very flexible in accessing member variables and member functions. These access methods maybe look unusual and unnecessary at first glance; but they are very useful sometimes; specially when you work with SimpleXML classes and objects.

PHP Form Handling - W3Schools
Classes are the blueprints/templates of php objects. Classes don't actually become objects until you do something called: instantiation. When you instantiate a class, you create an instance of it … thus creating the object. In other words, instantiation is the process of creating an instance of an object in memory.
