You have already learned about Earth's surface and that it is covered with a lithosphere that is broken into pieces called "plates." Plate tectonics is the study of the movement of these plates. It is a relatively new field of study. Scientists have only arrived at our current understanding of plate tectonics over the past 40 years.

Plate Tectonics Why It Matters Huge, moving slabs of rock called tectonic plates constantly reshape Earth's surface. For example, the island of Iceland is being torn where two tectonic plates are moving apart. Iceland is one of the few places where this process can be seen on land. 1 Continental Drift Wegener's Hypothesis Sea-Floor Spreading

A single plate can be made of all oceanic lithosphere or all continental lithosphere, but nearly all plates are made of a combination of both. Movement of the plates over Earth's surface is termed plate tectonics. Plates move at a rate of a few centimeters a year, about the same rate fingernails grow.

Plate Boundaries: Convergent, Divergent, and Transform Boundaries. In the theory of plate tectonics, the earth's crust is broken into plates that move around relative to each other. As a result of this movement, three types of plate boundaries are formed: divergent, convergent, and transform boundaries.
