in the range of 104–105. In the solid state, polymer molecules pack the space with little voids either in a regular array (crystalline) or at random (amorphous). The molecules are in close contact with other polymer molecules. In solutions, in contrast, each polymer mole- cule is surrounded by solvent molecules.

Flow Properties of Polymers Time-independent Fluids. Polymer solutions, dispersions, and melts are usually non-Newtonian liquids. This means their apparent viscosity (η) 1 depends on the applied shear rate and increases rapidly with increasing molecular weight (number of repeat units). Thus, the viscosity of a polymer melt is always larger than that of the corresponding monomer.

Polymer solution - Wikipedia

Polymer solutions undergo a liquid–liquid phase separation where the polymer-rich phase is referred to as the coacervate phase. Dispersion of formed colloids is unstable and there is a tendency for coalescence (merging of colloids).

Theta solvent - Wikipedia

Overall, the system requires less than 50 μL of material to produce a polymer solution sample. After the reaction channel, another input allows another fluid to be introduced. This could be, for example, a second solvent that changes the solution behavior of the polymer reaction products.

Semidilute and Concentrated Polymer Solutions

IUPAC definition. A polymer is a substance composed of macromolecules. A macromolecule is a molecule of high relative molecular mass, the structure of which essentially comprises the multiple repetition of units derived, actually or conceptually, from molecules of low relative molecular mass.

Chapter 4 Polymer solutions 4.1 Introduction Solution: any phase containing more than one component.(gas, liquid or solid) Polymer solution is important: • Classical analyses of polymers are conducted on dilute solutions size exclusion chromatography osmometry, viscometry light scattering. • Application: adhesives and coatings.

Polymer Solution | Article about Polymer Solution by The ...

Polymer solutions are solutions containing dissolved polymers. These may be liquid solutions (e.g. in aqueous solution), or solid solutions (e.g. a substance which has been plasticized). The introduction into the polymer of small amounts of a solvent (plasticizer) reduces the temperature of glass transition,...

A Glossary of Materials Science Terms - Polymer Solutions

Viscosity of Polymer Solutions Part I: Intrinsic Viscosity of Dilute Solutions. High molecular weight polymers greatly increase the viscosity of liquids in which they are dissolved. The increase in viscosity is caused by strong internal friction between the randomly coiled and swollen macromolecules and the surrounding solvent molecules.

In rheology, shear thinning is the non-Newtonian behavior of fluids whose viscosity decreases under shear strain. It is sometimes considered synonymous for pseudoplastic behaviour, and is usually defined as excluding time-dependent effects, such as thixotropy.

Polymer Solutions Definition

Polymer solutions are used in producing fibers, films, glues, lacquers, paints, and other items made of polymer materials. The introduction into the polymer of small amounts of a solvent (plasticizer) reduces the temperature of glass transition, the yield temperature, and the viscosity of the melt.

Polymer - Wikipedia

Polymer solution casting is a manufacturing process used to make flexible plastic

components which are typically in the shape of a single or multi-lumen tube commonly utilized in the medical device industry. This manufacturing technology is unique in that the process does not require conventional extrusion or injection molding technologies, yet it readily incorporates components and features traditionally produced by these processes. The polymer solution casting process utilizes a mandrel, or in

Emulsion Polymers - StanChem Polymers

In a polymer solution, a theta solvent (or θ solvent) is a solvent in which polymer coils act like ideal chains, assuming exactly their random walk coil dimensions. Therefore, the Mark-Houwink equation exponent is $1/2$ in a theta solvent. Thermodynamically, the excess chemical potential of mixing between a polymer and a theta solvent is zero.
