Simplifying and Factoring Expressions - dummies
- [Instructor] There are many videos on Khan Academy where we talk about factoring polynomials. What we're going to do in this video is do a few more examples of factoring higher degree polynomials. So let's start with a little bit of a warmup. Let's say that we wanted to factor six x squared plus nine x times x squared minus four x plus four.

How to Factor a Polynomial Expression - dummies
Factoring quadratic polynomials. Factoring can be tricky, especially when you need to factor a polynomial with large coefficients, such as $15x^2 + 47 - 10$. Here's an easy way to factor quadratic polynomials of the form $ax^2 + bx + c$: Begin by drawing a large X, placing the value ac in the top quadrant and b in the bottom quadrant.

Expand and Simplify Polynomials Calculator
To factorize polynomial within the numerator or the denominator, first factor the polynomial within the numerator or the denominator. Step 2. Then simplify the fraction to lowest terms by canceling out any common monomials or polynomials that exist in both the numerator and denominator, if possible. Step 3.

Simplifying Polynomial Fractions – MathsTips.com
If a polynomial doesn't factor, it's called prime because its only factors are 1 and itself. When you have tried all the factoring tricks in your bag (GCF, backwards FOIL, difference of squares, and so on), and the quadratic equation will not factor, then you can either complete the square or use the quadratic formula to solve the equation. The choice is yours.
