Power Diode - Electronic Projects for Engineering Students

Power diodes are usually mounted on the heat-sink to dissipate power during diode operation. And the power diode is usually characterised by average current, rms current and peak current. Snubber circuits are useful when using the diodes in switching regimes, which saves the diode from over-voltage in the reverse recovery process.

The "Generation 5" SiC diodes use a new compact chip design, realized by merged pn junction engineering in the Schottky cell-field. This enables a smaller differential resistance per chip area. As a result, a reduction of the diode losses by up to 30 percent compared to the previous generation can be achieved; for example in a front-end boost stage for a 3-phase solar inverter operating at ...

power-diode. In power electronic circuits, this diode plays an essential role. It can be used as a rectifier in converter circuits, voltage regulation circuits, flyback / freewheeling diode, reverse voltage protection, etc. These diodes are related to signal diodes except for a slight disparity in its construction.

Parameter t_a is the interval between the zero crossing of the diode current to it reaches I_{RR} . Parameter t_b is the time interval from the maximum reverse recovery current to 0.25 of I_{RR} . The lower t_{rr} means fast diode switching. The ratio of the two parameters t_a and t_b is known as the softness factor SF. Datasheet Parameters: For power diodes, a data sheet will give two voltage ratings.

Power diodes are also similar to signal diodes but have a little difference in its construction. In signal diodes the doping level of both P and N sides is same and hence we get a PN junction, but in power diodes we have a junction formed between a heavily doped P + and a lightly doped N - layer which is epitaxially grown on a heavily doped N + layer.
