We show a systematic methodology to create DSP + field-programmable logic hybrid architectures by viewing it as a hardware/software codesign problem. This enables an embedded processor architect to evaluate the trade-offs in the increase in die area due to the field programmable logic and the resultant improvement in performance or code size.

University of California, Berkeley Technical Report No. UCB/ERL M93/80 1993. Field programmable logic devices (FPLDs) are fast emerging as viable alternatives to mask programmed parts because of their rapid time-to-market and low costs. Their application has,

however, been limited to implementing random logic, with non-critical timing specifications.

Verilog-to-Routing (VTR) is an open source CAD flow for FPGA devices. VTR's main purpose is to map a given circuit described in Verilog, a Hardware Description Language, on a given FPGA architecture for research and development purposes; the FPGA architecture targeted could be a novel architecture that a researcher wishes to explore, or it could be an existing commercial FPGA whose ...
