Ray Tracing The Next Week

For a ray to hit one interval we first need to figure out whether the ray hits the boundaries. For example, again in 2D, this is the ray parameters t_0 and t_1 . (If the ray is parallel to the plane those will be undefined.) In 3D, those boundaries are planes. The equations for the planes are $x = x_0$, and $x = x_1$. Where

In ray tracing, this is usually done with an `_instance_`. An instance is a geometric primitive that has been moved or rotated somehow. This is especially easy in ray tracing because we don't move anything; instead we move the rays in the opposite direction. For example, consider a `_translation_` (often called a `_move_`).
