Life-cycle tests are run to evaluate and predict reliability and durability of a product using accelerated stress conditions for each life-cycle phase. A life-cycle test can be performed using a success-run or test-to-failure approach, and results can identify design weaknesses or evaluate performance at extreme operating conditions.

Reliability Life Testing And The

Reliability and Accelerated Life Testing. The experts at DfR Solutions work with our clients every day to develop realistic worst-case use cases ('personas'), leverage our knowledge of degradation mechanisms and industry best practices to create robust test plans, and design and build custom fixtures to make testing of their component, product, or system highly useful and relevant.

Reliable Life (warranty time). The estimated time when the reliability will be equal to a specified goal. For example, the estimated time of operation is 4 years for a reliability of 90%. B(X) Life: The estimated time when the probability of failure will reach a specified point (X%). For example, if 10% of the products are expected to fail by 4 years of operation, then the B(10) life is 4 years.

Quantitative Accelerated Life Testing. Reliability information can include the probability of failure of the product under use conditions, mean life under use conditions, and projected returns and warranty costs. It can also be used to assist in the performance of risk assessments, design comparisons, etc.
