Water Cycle Bag Levels - CELF Environmental Literacy
The hydrologic cycle is an important feature of all ecosystems, and particularly forests, which generally grow in climates where precipitation provides more water than the vegetation can use or soils can store. The excess water contributes to stream flow, which provides for irrigation and urban needs far from the source of precipitation.

HYDROLOGIC CYCLE The hydrologic cycle is a constant movement of water above, on, and below the earth's surface. It is a cycle that replenishes ground water supplies. It begins as water vaporizes into the atmosphere from vegetation, soil, lakes, rivers, snowfields and oceans—a process called evapotranspiration.
