Mathematical Description Single waves. A wave can be described just like a field, namely as a function  $(\mathbf{r}, t)$  where  $\mathbf{r}$  is a position and  $t$  is a time.. The value of  $\mathbf{r}$  is a point of space, specifically in the region where the wave is defined. In mathematical terms, it is usually a vector in the Cartesian three-dimensional space. However, in many cases one can ignore one dimension, and let  $\mathbf{r}$  be a point of the ...

is nowhere infinite,  $\nabla \cdot \mathbf{v} = 0$  at some point implies  $\nabla \cdot \mathbf{v} = 0$  everywhere. Alternatively, if we know the solution for any size  $x$ -interval, the full solution is fully determined.

In potential theory, the Laplace/Runge/Lenz (LRL) vector is a vector used chiefly to describe the shape and orientation of the orbit of one astronomical body around another, such as a planet revolving around a star. For two bodies interacting by Newtonian gravity, the LRL vector is a constant of motion, meaning that it is the same no matter where it is calculated on the orbit; equivalently ...

Turret mechanics dictate how accurately turrets hit and how much damage is dealt. It is obvious that these two are connected since missing shots directly affects applied damage but the hit and damage mechanics are actually connected in another way too.
