SQL is About Table References. If a has 3 records and b has 5 records, then the above combined table reference will produce 15 records ( 3 x 5 ). This "output" is "fed" / "piped" into the GROUP BY clause (after filtering in the WHERE clause), where it is transformed into a new "output". We'll deal with that later on.

In order for our model to be in third normal form, we need to remove the transitive dependencies. As we stated our dependency is: CustomerCity relies on CustomerPostalCode which relies on CustomerID. It is OK that CustomerPostalCode relies on CustomerID; however, we break 3NF by including CustomerCity in the table.
