A.C. Harvey (1989) in his book *Forecasting, Structural Time Series Models and the Kalman Filter* (Cambridge University Press). Here we will introduce the model as an “organizing model” for the discussion of time series modeling in general but also to compare and contrast the UCM model with other time series models to come, namely, the

Structural Time Series Models: theory and application

Introduction State-space models were originally developed by control engineers, particularly for applications that require continuous updating of the current position. An example, from the field of navigation systems, is updating an user equipment’s position. The models have also found increasing use in many types of time-series problems, including parameter estimation, smoothing, and ...

STRUCTURAL TIME SERIES MODELS The essence of a structural model is that it is formulated in terms of independent components which have a direct interpretation in terms of quantities of interest. One of the most important models for economic time series is the basic structural model: this consists of a trend, a seasonal and an irregular component.

A Structural Time Series Model (STM), is formulated directly in terms of unobserved components, such as a trend (level and slope), a seasonal, a cycle and an irregular component (disturbances).

Predicting the Present with Bayesian Structural Time Series

This paper models and estimates the Beveridge-Nelson decomposition of multivariate time series in an unobserved components framework. This is an alternative to standard approaches based on VAR and VECM models. The appeal of this method lies in its transparency and structural character. The basic model parsimoniously nests a large set of common

series data using structural time series models, also called unobserved components models (UCM). These models represent the observed series as a sum of suitably chosen components such as trend, seasonal, cyclical, and regression effects.

Inferring causal impact using Bayesian structural time ...

The basic idea of structural time series models is that they are set up as regression models in which the explanatory variables are functions of time with coefficients which change over time. Thus within a regression framework a simple trend would be modeled in terms of a constant and a time with a random disturbance added on, that is.

The Unobservable Components Model

a univariate numeric time series. Missing values are allowed. type: the class of structural model. If omitted, a BSM is used for a time series with frequency(x) > 1, and a local trend model otherwise. init: initial values of the variance parameters. fixed: optional numeric vector of the same length as the total number of parameters.

the process $\theta(t)$ degenerates to a simple linear time trend. The seasonal component of the structural time-series model is described by the equation $\theta(t) + \theta(t-1) + \dots + \theta(t-s+1) = \theta(t)$ (14) or, equivalently, $S(z)\theta(z) = \theta(z)$, where $S(z) = 1 + z^{-1} + z^{-2} + \dots + z^{-s+1}$ is the seasonal summation operator, s

The link with econometrics is made even closer by the natural way in which the models can be extended to include explanatory variables and to cope with multivariate time series. From the technical point of view, state space models and the Kalman filter play a key role in the statistical treatment of structural time series models.

Bayesian structural time series (BSTS) model is a statistical technique used for feature selection, time series forecasting, nowcasting, inferring causal impact and other applications. The model is designed to work with time series data. The model has also promising application in the field of analytical marketing. In particular, it can be used in order to assess how much different marketing campaigns have contributed to the change in web search volumes, product sales, brand popularity and ...
