The structure and representations of the quantum supergroup $OSP_q(2|2n)$ are studied systematically. The algebra of functions on the quantum supergroup, which specifies the quantum supergroup itself, is taken to be the superalgebra generated by the matrix elements of the universal superalgebra $U_q(\mathfrak{osp}(2|2n))$.

Chapter 3: Representations of finite groups: basic results

We introduce induction and restriction functors to the category \mathcal{O} of $U_q(\mathfrak{b})$. As a by product we classify simple finite-dimensional representations of $U_q(\widehat{\mathfrak{g}})$ and we obtain a cluster algebra structure on the representations.

In group theory, the quaternion group Q_8 (sometimes just denoted by Q) is a non-abelian group of order eight, isomorphic to a certain eight-element subset of the quaternions under multiplication. It is given by the group presentation $\langle e, i, j, k \mid i^2 = j^2 = k^2 = -1, ij = ji^{-1}, jk = kj^{-1}, ki = ik^{-1} \rangle$, where e is the identity element of the group.

The structure of the universal q-central extension of the q-Witt algebra, the q-Virasoro algebra, is also determined. q-Lie algebras are investigated and the q-PBW theorem for the universal enveloping algebras of q-Lie algebras is proved. A realization of a class of representations

Discovering the underlying structure of a dynamical environment involves learning representations that are interpretable and disentangled, which is a challenging task. In physics, interpretable representations of our universe and its underlying dynamics are formulated in terms of transformations. We propose a physics-inspired method, built upon the theory ...
