The boundary element method (BEM) also known as the boundary integral equation method (BIEM) is now firmly established in many engineering disciplines (see Aliabadi, 2002; Wrobel, 2002). The attraction of the method can be largely attributed to the reduction in the dimensionality of the problem;

the solution to a PDE by looking at the solution to the PDE on the boundary and then use that information to find the solution inside the domain. This sounds like a strange idea, but it is a very powerful tool for finding solutions.

Principles of Boundary Element Methods

The boundary element method is one of a variety of numerical methods for the solution of problems in applied science and engineering. However, it is not as frequently taught in the undergraduate curriculum as are the finite difference and the finite element methods.

The Boundary Element Method (BEM) n. n. n • Boundary element method applies surface elements on the boundary of a 3-D domain and line elements on the boundary of a 2- D domain. The number of elements is $O(n^2)$ as compared to $O(n^3)$ in other domain based methods (n = number of elements needed per dimension).

finite difference method or the finite element method, the methodology of formulating boundary value problems as boundary integral equations describes problems only by equations with known and unknown boundary states. Hence, it only requires discretization of the surface rather than the volume, i.e., the dimension of problems is reduced by one.

integral equation method or boundary integral method, has gradually evolved to become one of the few widely used numerical techniques for solving boundary value problems in engineering and physical sciences. In implementing the method, only the boundary of the solution domain has to be discretized into elements.
