Once we find the electric potential function $V(r)$, we can then determine the total electric field by taking the gradient: $E(r) = -\nabla V(r)$. Thus, we now have three (!) potential methods for determining the electric field produced by some charge distribution $\rho(r)$: 1. Determine $E(r)$ from Coulomb's Law.

Electric Potentials graphs | Physics Forums

An electric potential (also called the electric field potential, potential drop or the electrostatic potential) is the amount of work needed to move a unit of charge from a reference point to a specific point inside the field without producing an acceleration. Typically, the reference point is the Earth or a point at infinity, although any point can be used.
