Python functions vs. mathematical functions. In what follows, we deal with functions in the sense of programming languages.

Mathematical functions, as manipulated in calculus, are handled by Sage in a different way. In particular it doesn't make sense to do mathematical manipulation such as additions or derivations on Python functions.

The word copula is a Latin noun that means a link and is used in grammar to describe the part of a proposition that connects the subject and predicate. Abe Sklar in 1959 was the first to introduce the word copula in a mathematical or statistical sense in a theorem describing the functions that join together one-dimensional distribution functions to form multivariate distribution functions.

Two problems often exist with deep copy operations that don't exist with shallow copy operations: Recursive objects (compound objects that, directly or indirectly, contain a reference to themselves) may cause a recursive loop. Because deep copy copies everything it may copy too much, such as data which is intended to be shared between copies.

Note. This function works by applying a set of rules that are guaranteed to convert the formula. Worst case the converted expression has an $\mathcal{O}(2^n)$ increase in size (and time as well), but if the formula is already in CNF (or close to) it is only $\mathcal{O}(n)$.. This function can require an exponential blow up in space from the original expression.
