Steam Engineering Basics 5

Looking into the firebox through its
side opening, you see that the
space above the fire is roofed by
the sloping water tubes. The flames
of the fire, and its hot gases, flow
between and around the many
layers of tubes that are above the
fire.

Steam is then injected into the upper well, while producing the lower well. As a result, steam rises forming a steam chamber with oil flowing at the sides of the chamber and condensate flowing inside the chamber, as shown in Fig. 15.36. This is an idealized situation. Other flow regime may occur depending on the oil and formation properties.
