Since the Renaissance, every century has seen the solution of more mathematical problems than the century before, yet many mathematical problems, both major and minor, still remain unsolved. Unsolved problems occur in multiple domains, including physics, computer science, algebra, and combinatorics, algebraic, differential, discrete and Euclidean geometries, graph, group, model, number, set and Ramsey theories, dynamical systems, partial differential equations, and more. problem

The term problem defines J. Linhart (1976, p. 385) as: a) a problem is an interactive relation between a subject and its surroundings, which incorporates the inner conflict that is solved by the subject through the searching of transitions from initial condition to the final condition (aim), b) the existence of a conflict causes the dynamics of an activity and, furthermore, it establishes a source of motivation for the activity, c) during the solving of a conflict, the subject exceeds something that is directly ...
