The line-of-sight propagation will not be smooth if there occurs any obstacle in its transmission path. As the signal can travel only to lesser distances in this mode, this transmission is used for infrared or microwave transmissions. Ground Wave Propagation. Ground wave propagation of the wave follows the contour of earth.

## **Transmission Lines And Wave Propagation**

In radio-frequency engineering, a transmission line is a specialized cable or other structure designed to conduct alternating current of radio frequency, that is, currents with a frequency high enough that their wave nature must be taken into account. Transmission lines are used for purposes such as connecting radio transmitters and receivers with their antennas (they are then called feed ...

Table: Wave Velocity and Characteristic Impedance of Various Mediums. Each medium acts as a transmission line. The velocity is  $v$  and the characteristic impedance is  $Z_0$ . The high-frequency resistance of wires is proportional to  $\sqrt{f}$ , due to the skin effect, which we will discuss later. For now, the table gives  $R$  for  $f = 1$  kHz. We obtained  $R$  for the cables by adding the conductor and ...

4.6.1 Derivation of Transmission Line Properties In this section the differential equations governing the propagation of signals on a transmission line are derived. Solution of the differential equations describes how signals propagate, and leads to the extraction of a few parameters that describe transmission line properties.

## **Velocity factor - Wikipedia**

In a sense, all transmission lines function as conduits of electromagnetic energy when transporting pulses or high-frequency waves, directing the waves as the banks of a river direct a tidal wave. However, because waveguides are single-conductor elements, the propagation of electrical energy down a waveguide is of a very different nature than the propagation of electrical energy down a two ...

The velocity factor (VF), also called wave propagation speed or velocity of propagation (VoP or ), of a transmission medium is the ratio of the speed at which a wavefront (of an electromagnetic signal, a radio signal, a light pulse in an optical fibre or a change of the electrical voltage on a copper wire) passes through the medium, to the speed of light in a vacuum.
