X Ray Photoelectron Spectroscopy Xps

X-ray photoelectron spectroscopy (XPS) is a surface-sensitive quantitative spectroscopic technique that measures the elemental composition at the parts per thousand range, empirical formula, chemical state and electronic state of the elements that exist within a material. Put more simply, XPS is a useful measurement technique because it not only shows what elements are within a film but also what other elements they are bonded to.

What is X-Ray Photoelectron Spectroscopy (XPS)?

X-ray photoelectron spectroscopy (XPS), which is also referred to as X-ray photoemission spectroscopy, is a surface analysis technique that is based on energy-spectrum measurements of photoelectrons emitted from a material surface under irradiation with a monochromatic soft X-ray radiation [1]. XPS is routinely used for a qualitative and/or quantitative analysis of surface elemental compositions and a chemical or an electronic state analysis of each element in the sample surface.
